

- AWS AGENTS FOR HUMANS HACKATHON · PROFESSIONAL AGENTS TRACK

FollowFlow

Autonomous Commitment Network

Keep your promises. Let AI handle the follow-through.

The autonomous operations agent that detects commitments, monitors deadlines in the background, collects objective evidence across industry tools, and verifies completion without nagging.

AWS Strands Agents SDK

v1.55.1 custom
tool decorators
for SLA
compliance,
business

Amazon Bedrock AgentCore

Production-
ready /ping &
/invocations
runtime contract

Amazon ECS Fargate Multi-AZ

Live
containerized
deployment
backing AWS

THE PROBLEM

Work Shouldn't Get Stuck in Broken Promises

Knowledge workers make commitments daily across Slack, meetings, emails, and PRs. Most disappear until someone gets angry.

1. The 60% Promise Drop-off

"I'll send the SOC2 checklist by Friday" or "I'll review the architecture PR tomorrow" slip through the cracks because informal commitments are never structured or continuously monitored.

Status:
Untracked &
Forgotten

2. The Human Nagging Tax

Managers and leads spend 20%+ of their workweek checking in, sending Slack DMs, and scheduling status meetings just to ask: *"Is this done yet?"*

Cost: 4-6
hrs/week
wasted per
lead

3. The Static Issue-Tracker Flaw

Jira and Linear record intent through manual ticket creation, but they provide zero autonomous follow-through, zero objective evidence inspection, and zero proactive risk intervention.

Gap: Passive
record, not
active agent

THE SOLUTION

FollowFlow: The Autonomous AI Employee

Instead of another app you have to manage, FollowFlow works autonomously in the background and only surfaces when a human decision is needed.

✦ Zero-Overhead AI Extraction

The inline Strands AI Copilot extracts structured promises directly from conversation: owner (@username), deliverable criteria, deadline horizon, and team SLA scope.

⚙️ Autonomous 5-Step Agent Loop

Continuously runs *Observe* → *Reason* → *Act* → *Wait* → *Verify*. Calculates deadline horizons, monitors risk tiers (Active, Due Soon, Critical), and dispatches contextual follow-ups via Amazon SES.

🔍 Objective Multi-App Verification

Validates completion against real artifacts: merged GitHub PRs, Slack #Done receipts, Notion PRD statuses, and AWS S3 deliverable uploads.

🛡️ Ambiguity Stop Rule (HITL Gateway)

When confidence is high, it marks work fulfilled autonomously. When evidence is ambiguous or conflicting, it pauses, explains why it stopped, and awaits a 1-click human decision.

CLOUD ARCHITECTURE

End-to-End AWS Production Architecture

High-concurrency distributed runtime powered by AWS Strands Agents SDK v1.55.1 and Amazon ECS Fargate.

STRANDS SDK IMPLEMENTATION

AWS Strands Agents SDK v1.55.1 Deep Dive

Registered tool chain, asynchronous bridge, and Bedrock AgentCore runtime compatibility.

1. Custom Tool Chain

Decorated with Strands @tool:

```
@tool
def
lookup_industry_in

@tool
def
calculate_commitme

@tool
def
verify_sla_complia
```

Instantiated via
Agent(tools=[...],
model="anthropic.claude-3")

2. Bedrock AgentCore Ready

Full compliance with Amazon Bedrock AgentCore managed agent loop:

```
GET /ping
→ 200 OK
Container Health

POST /invocations
→ Native Bedrock Agent Execution
```

Deployable seamlessly to Bedrock AgentCore Harness

3. Async Concurrency

High-throughput bridge between synchronous agent tools and FastAPI's asynchronous loop:

```
# Non-blocking executor bridge
res = await
asyncio.to_thread(

agent_architect.run_prompt
)
```

Zero thread starvation under concurrent API traffic

ENTERPRISE POLISH

Enterprise Sign-In Wall & Cryptographic Trust

Zero dummy mock data. Built with real PostgreSQL multi-tenancy, authentic authentication, and immutable SHA-256 audit digests.

Enterprise Sign-In Wall

Protected route guards on all internal pages (/dashboard, /commitments, /settings). Unauthenticated traffic is intercepted. Clean login card with Google SSO, AWS Identity Center, and password toggles.

36 Real Database Personas

Every user (@rahulk, @devon_c, @sarah_c) is a persistent database record with unique roles, historical reliability scores, and team affiliations. Zero hardcoded mock users in UI components.

Multi-Tenant SLA Governance

Organizations (FollowFlow Labs) host scoped teams with independent 95% target fulfillment SLA policies and automated grace period buffers (24h–72h).

Cryptographic Proof Ledger

Inspired by AWS Builder Center Badges: every fulfilled promise produces an immutable SHA-256 digest (e.g. FF-AWS-2026-BEDROCK) for verifiable SOC 2 audit readiness.

LIVE PRODUCTION CLOUD

Deployed, Live, and Ready to Evaluate

FollowFlow is fully operational on Amazon ECS Fargate and accessible worldwide via custom edge domains.

Judging Criteria Alignment

1. Technological

Implementation: Working Strands SDK v1.55.1 @tool chains + Bedrock AgentCore /ping & /invocations + ECS Fargate deployment.

2. Design: Complete, quiet Linear/Vercel product experience with Bento grid metrics and Inter typography.

3. Potential Impact: Directly eliminates the 60% promise drop-off; recovers 4–6 hrs/week of status meetings.

4. Creativity: Shifts the paradigm from subjective manual check-ins to objective, verifiable multi-app proof.

5. Presentation: Full 5-minute video, live public URL, and comprehensive architecture artifacts.
